

Using the **R Code** and **Git Example** Environments with **knitr**

Alan's Modifications and Notes

September 2, 2015

1 Introduction

This is a test of the **R Code** and **Git Example** environments. By the way, this document was last compiled Wednesday, September 02, 2015 - 15:02:27.

1.1 Simple Arithmetic

R Code 1.1

```
1 + 1  
  
[1] 2
```

1.2 Generate Random Data

R Code 1.2

```
set.seed(13)  
x <- rnorm(100)
```

Find the standard deviation of **x**.

R Code 1.3

```
sd(x) # standard deviation  
  
[1] 0.9508399
```

Note that **R Code** [1.2](#) and [1.3](#) are hyperlinked! The standard deviation of **x** is computed in **R Code** [1.3](#) and is 0.9508399.

1.3 Graphs and Environments

R Code 1.4

```
set.seed(41)
junk <- rnorm(10000)
MEAN <- mean(junk)
MEAN

[1] 0.006226888
```

The mean of the junk is 0.0062269. Note: It seems that an error is thrown if a code chunk with a graph and `rcode` is executed at the same time. Work around is as shown below. That is, hide the figure when showing the code...then show the figure with a separate code chunk. Note that [Figure 1](#) is hyperlinked!

R Code 1.5

```
library(ggplot2)
ggplot(data = mtcars) +
  geom_density(aes(x = mpg), fill = "pink") +
  theme_bw() +
  labs(x = "miles per gallon", y = "", title = "\\alpha + \\beta = \\delta")
```

Figure 1: This is where you explain your graph

2 Git Stuff

When working with OSX, one may want to change `engine = 'sh'` to `engine = 'bash'`.

Git Example 2.1

```
git config --list

user.name=Alan Arnholt
user.email=arnholtat@appstate.edu
credential.helper=osxkeychain
color.ui=auto
core.repositoryformatversion=0
core.filemode=true
core.bare=false
core.logallrefupdates=true
core.ignorecase=true
core.precomposeunicode=false
remote.origin.url=https://github.com/alanarnholt/STT4870.git
remote.origin.fetch=+refs/heads/*:refs/remotes/origin/*
branch.master.remote=origin
branch.master.merge=refs/heads/master
```

Look at **R Code 1.1 on page 1** to add `1 + 1` and get the answer 2. The output from **Git Example 2.1** shows how my machine is configured. **Git Example 2.2** shows the log.

Git Example 2.2

```
git log --pretty=oneline -3

808bf9beb0b4440900336114851056f3c4882dcc recent tables
6f746b5cbea84366868a126f3eed28640a0e3469 updates with stuff
47da7dec3ba802aaa0ce1879e659e7ca2d91a072 table stuff
```

3 Using L^AT_EX in Graphs

How about some more L^AT_EX in a ggplot2 graph.

R Code 3.1

```
f <- function(x){sqrt(2/(x - 1))*gamma(x/2)/gamma((x - 1)/2)}
library(ggplot2)
p <- ggplot(data.frame(x = c(2, 50)), aes(x = x))
p + stat_function(fun = f) +
  labs(x = "$n$", y = "$\\frac{\\sqrt{2}}{\\sqrt{n-1}}\\frac{\\Gamma(\\frac{n}{2})}{\\Gamma(\\frac{n-1}{2})}$") +
  theme_bw() +
  geom_hline(yintercept = 1, lty = "dashed")
```

- R version 3.2.1 (2015-06-18), x86_64-apple-darwin13.4.0
- Locale: en_US.UTF-8/en_US.UTF-8/en_US.UTF-8/C/en_US.UTF-8/en_US.UTF-8
- Base packages: base, datasets, graphics, grDevices, methods, stats, utils
- Other packages: filehash 2.2-2, ggplot2 1.0.1, knitr 1.10.5, tikzDevice 0.8.1
- Loaded via a namespace (and not attached): codetools 0.2-11, colorspace 1.2-6, digest 0.6.8, evaluate 0.7.2, formatR 1.2, grid 3.2.1, gtable 0.1.2, highr 0.5, labeling 0.3, magrittr 1.5, MASS 7.3-42, munsell 0.4.2, plyr 1.8.3, proto 0.3-10, Rcpp 0.12.0, reshape2 1.4.1, scales 0.3.0, stringi 0.5-5, stringr 1.0.0, tools 3.2.1
